

Without a standardized screening tool, only 30% of developmental disabilities are detected.

With a standardized screening tool, 70-80% are.

That's why we're screening children at the 9 and 18 month well-visit!

"Sometimes you get to begin to think that you're just too busy to try anything new or different in your practice... [but] it's a very empowering experience to have that chance to take something new that you think may have a really positive effect on patients, try it out and see it to completion, and actually see the value of it."

~Dr. Risco, Children's Hospital Boston, on implementing developmental screening
